## 1 Overall quality at a glance (i)

The following experimental techniques were used to determine the structure:

## X-RAY DIFFRACTION

The reported resolution of this entry is $2.43 \AA$.
Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | Whole archive <br> (\#Entries) | Similar resolution <br> (\#Entries, resolution range $(\AA)$ ) |
| :---: | :---: | :---: |
| $\mathrm{R}_{\text {free }}$ | 130704 | $1564(2.46-2.42)$ |
| Clashscore | 141614 | $1631(2.46-2.42)$ |
| Ramachandran outliers | 138981 | $1617(2.46-2.42)$ |
| Sidechain outliers | 138945 | $1617(2.46-2.42)$ |
| RSRZ outliers | 127900 | $1547(2.46-2.42)$ |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the electron density. The red, orange, yellow and green segments of the lower bar indicate the fraction of residues that contain outliers for $>=3,2,1$ and 0 types of geometric quality criteria respectively. A grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions $<=5 \%$ The upper red bar (where present) indicates the fraction of residues that have poor fit to the electron density. The numeric value is given above the bar.

## 3 Residue-property plots (i)

These plots are drawn for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic for a chain summarises the proportions of the various outlier classes displayed in the second graphic. The second graphic shows the sequence view annotated by issues in geometry and electron density. Residues are color-coded according to the number of geometric quality criteria for which they contain at least one outlier: green $=0$, yellow $=1$, orange $=2$ and red $=3$ or more. A red dot above a residue indicates a poor fit to the electron density (RSRZ $>2$ ). Stretches of 2 or more consecutive residues without any outlier are shown as a green connector. Residues present in the sample, but not in the model, are shown in grey.

## 5 Model quality (i)

### 5.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: HYP, EDO, NAG

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with $|Z|>5$ is considered an outlier worth inspection. RMSZ is the root-mean-square of all Z scores of the bond lengths (or angles).

| Mol | Chain | Bond lengths |  | Bond angles |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | RMSZ | $\#\|Z\|>5$ | RMSZ | $\#\|Z\|>5$ |

| All | All | 0.43 | $0 / 6191$ | 0.65 | $0 / 8429$ |

There are no bond length outliers.
There are no bond angle outliers.
There are no chirality outliers.
There are no planarity outliers.

### 5.2 Too-close contacts (i)

In the following table, the Non- H and H (model) columns list the number of non-hydrogen atoms and hydrogen atoms in the chain respectively. The H (added) column lists the number of hydrogen atoms added and optimized by MolProbity. The Clashes column lists the number of clashes within the asymmetric unit, whereas Symm-Clashes lists symmetry-related clashes.
