# 1 Overall quality at a glance (i)

The following experimental techniques were used to determine the structure:  $SOLUTION\ NMR$ 

The overall completeness of chemical shifts assignment is 18%.

Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions <=5%

# 2 Ensemble composition and analysis (i)

This entry contains 10 models. This entry does not contain polypeptide chains, therefore identification of well-defined residues and clustering analysis are not possible. All residues are included in the validation scores.

# 3 Entry composition (i)

There is only 1 type of molecule in this entry. The entry contains 1042 atoms, of which 362 are hydrogens and 0 are deuteriums.

• Molecule 1 is a DNA chain called DNA (5'-D(\*GP\*IP\*GP\*TP\*GP\*GP\*GP\*GP\*GP\*GP\*GP\*GP\*GP\*)-3').

# 4 Residue-property plots (i)

## 4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

# 5 Refinement protocol and experimental data overview (i)

The models were refined using the following method: DGSA-distance geometry simulated annealing, distance-restrained molecular dynamics refinement in vacuo, distance-restrained molecular dynamics refinement in explicit solvent.

Of the 100 calculated structures, 10 were deposited, based on the following criterion: *structures with the lowest energy*.

The following table shows the software used for structure solution, optimisation and refinement.

Software name	Classification	Version
X-PLOR NIH	structure solution	2.27
Amber	refinement	10

# 6.1 Standard geometry (i)

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with |Z| > 5 is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).

Mol Chain		B	ond lengths	Bond angles		
	Ullaili	RMSZ	$\#Z{>}5$	RMSZ	#Z > 5

## 6.2 Too-close contacts (i)

In the following table, the Non-H and H(model) columns list the number of non-hydrogen atoms and hydrogen atoms in each chain respectively. The H(added) column lists the number of hydrogen atoms added and optimized by MolProbity. The Clashes column lists the number of clashes averaged over the ensemble.

Mol	Chain	Non-H	H(model)	H(added)	Clashes

The all-atom clashscore is defined as the number of clashes found per 1000 atoms (including hydrogen atoms). The all-atom clashscore for this structure is 14.

# 10 Dihedral-angle violation analysis (i)

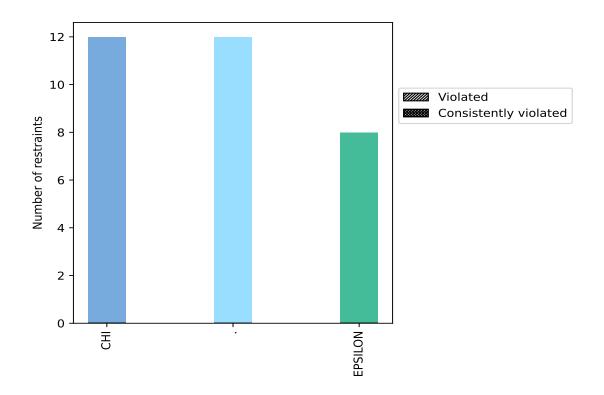

# 10.1 Summary of dihedral-angle violations (i)

The following table provides the summary of dihedral-angle violations in different dihedral-angle types. Violations less than  $1^{\circ}$  are not included in the calculation.

Angle type	Count	$\%^1$	$Violated^3$			Consistently Violated <sup>4</sup>		
Angle type			Count	$\%^2$	$\%^1$	Count	$\%^2$	$\%^1$
CHI	12	37.5	0	0.0	0.0	0	0.0	0.0
•	12	37.5	0	0.0	0.0	0	0.0	0.0
EPSILON	8	25.0	0	0.0	0.0	0	0.0	0.0
Total	32	100.0	0	0.0	0.0	0	0.0	0.0

 $^1$  percentage calculated with respect to total number of dihedral-angle restraints,  $^2$  percentage calculated with respect to number of restraints in a particular dihedral-angle type,  $^3$  violated in at least one model,  $^4$  violated in all the models

#### 10.1.1 Bar chart : Distribution of dihedral-angles and violations (i)

Violated and consistently violated restraints are shown using different hatch patterns in their respective categories

## 10.2 Dihedral-angle violation statistics for each model (i)

No violations found

### 10.3 Dihedral-angle violation statistics for the ensemble (i)

No violations found

### 10.4 Most violated dihedral-angle restraints in the ensemble (i)

No violations found

### 10.5 All violated dihedral-angle restraints (i)

No violations found
