1 Overall quality at a glance (i)

The following experimental techniques were used to determine the structure: $SOLUTION\ NMR$

The overall completeness of chemical shifts assignment was not calculated.

Percentile scores (ranging between 0-100) for global validation metrics of the entry are shown in the following graphic. The table shows the number of entries on which the scores are based.

| Metric | Whole archive $(\# \mathrm{Entries})$ | $egin{array}{l} { m NMR \ archive} \ (\#{ m Entries}) \end{array}$ | |
|-----------------------|---------------------------------------|--|--|
| Clashscore | 158937 | 12864 | |
| Ramachandran outliers | 154571 | 11451 | |
| Sidechain outliers | 154315 | 11428 | |

The table below summarises the geometric issues observed across the polymeric chains and their fit to the experimental data. The red, orange, yellow and green segments indicate the fraction of residues that contain outliers for >=3, 2, 1 and 0 types of geometric quality criteria. A cyan segment indicates the fraction of residues that are not part of the well-defined cores, and a grey segment represents the fraction of residues that are not modelled. The numeric value for each fraction is indicated below the corresponding segment, with a dot representing fractions <=5%

| Mol | Chain | Length | Quality of chain | | |

| | | | | | |
| 1 | Α | 75 | 85% | 5% | 9% |

2 Ensemble composition and analysis (i)

This entry contains 30 models. Model 12 is the overall representative, medoid model (most similar to other models). The authors have identified model 1 as representative, based on the following criterion: *lowest energy*.

The following residues are included in the computation of the global validation metrics.

| Well-defined (core) protein residues | | | | | | |
|--------------------------------------|--|------|----|--|--|--|
| Well-defined core | Well-defined core Residue range (total) Backbone RMSD (Å) Medoid model | | | | | |

Ill-defined regions of proteins are excluded from the global statistics.

Ligands and non-protein polymers are included in the analysis.

The models can be grouped into 3 clusters and 1 single-model cluster was found.

4 Residue-property plots (i)

4.1 Average score per residue in the NMR ensemble

These plots are provided for all protein, RNA, DNA and oligosaccharide chains in the entry. The first graphic is the same as shown in the summary in section 1 of this report. The second graphic shows the sequence where residues are colour-coded according to the number of geometric quality criteria for which they contain at least one outlier: green = 0, yellow = 1, orange = 2 and red = 3 or more. Stretches of 2 or more consecutive residues without any outliers are shown as green connectors. Residues which are classified as ill-defined in the NMR ensemble, are shown in cyan with an underline colour-coded according to the previous scheme. Residues which were present in the experimental sample, but not modelled in the final structure are shown in grey.

• Molecule 1: Copper-transporting ATPase 1

4.2 Residue scores for the representative (medoid) model from the NMR ensemble

The representative model is number 12. Colouring as in section 4.1 above.

• Molecule 1: Copper-transporting ATPase 1

Refinement protocol and experimental data overview (i) 5

The models were refined using the following method: torsion angle dynamics coupled with simulated annealing followed by restrained energy minimization.

Of the 300 calculated structures, 30 were deposited, based on the following criterion: target function.

The following table shows the software used for structure solution, optimisation and refinement.

| Software name | Classification | Version |
|---------------|--------------------|---------|
| DYANA | structure solution | 1.5 |
| Amber | refinement | 5.0 |

No chemical shift data was provided.

6 Model quality (i)

6.1 Standard geometry (i)

Bond lengths and bond angles in the following residue types are not validated in this section: CU1

The Z score for a bond length (or angle) is the number of standard deviations the observed value is removed from the expected value. A bond length (or angle) with |Z| > 5 is considered an outlier worth inspection. RMSZ is the (average) root-mean-square of all Z scores of the bond lengths (or angles).

| Mol Chain | | В | ond lengths | Bond angles | | |
|-----------|-----------|-----------------|-----------------------------|-----------------|-----------------------------|--|
| IVIOI | Moi Chain | | #Z>5 | RMSZ $\#Z>5$ | | |
| 1 | A | 0.50 ± 0.01 | $0\pm0/532~(~0.0\pm~0.0\%)$ | 0.90 ± 0.02 | $0\pm0/722~(~0.0\pm~0.0\%)$ | |
| All | All | 0.50 | 0/15960 (0.0%) | 0.90 | 1/21660 (0.0%) | |

Chiral center outliers are detected by calculating the chiral volume of a chiral center and verifying if the center is modelled as a planar moiety or with the opposite hand. A planarity outlier is detected by checking planarity of atoms in a peptide group, atoms in a mainchain group or atoms of a sidechain that are expected to be planar.

| Mol | Chain | Chain Chirality | |
|-----|-------|-------------------|---------------|
| 1 | A | 0.0 ± 0.0 | $1.7{\pm}1.1$ |
| All | All | 0 | 52 |

There are no bond-length outliers.

All unique angle outliers are listed below.
